Summary on radio buttons

Radio buttons can be confusing when you're starting out.

But don't worry, that is why this course is put together - to help you QUICKLY learn about forms and maintain the information I teach.

The **<input type="radio">** defines a radio button.
The interesting thing about radio buttons is that they are usually presented in radio groups. In other words, radio buttons are usually an entire collection of buttons that describe a set of related options. Importantly, only **one** radio button in a group can be selected at the same time. This is what sets them apart from, say, checkboxes. Stay motivated, keep going and I will see you in the next lecture.

RADIO BUTTONS

Every radio button group should:

be wrapped within the <fieldset> &
labelled with a <legend>

have a <label> for each radio button

use the same name attribute

use different value attributes
